Social Media Growth Agent – Build Blueprint

This is a plan for an AI agent system that grows engagement and reach for our brands on Facebook and Instagram. It handles everything from research to publishing, and it gets better each week by learning from results.

Starting brands: an IELTS mock test platform and an LMS selling Islamic educational courses. The system is built so we can add new brands easily.

Goals

- Increase engagement and reach on Facebook and Instagram.
- Automate the full cycle: research, targeting, planning, content creation, publishing and learning.
- Learn from our own results and from what's working for local competitors.
- Keep human effort to one approval of each week's plan. Everything after that is automatic.

The Weekly Flow

1. **Research:** study the brand and local competitors on Facebook and Instagram.
2. **Targeting:** define audience personas, their pain points and the best hooks.
3. **Plan:** build a 7-day content calendar using lessons from past weeks.
4. **Approve:** a human reviews and approves the 7-day plan before any content is made. They can approve it or send it back with changes.
5. **Create:** once the plan is approved, write scripts and captions, and produce reels, images and carousels. A reviewer subagent checks every post before it's scheduled, with no human review at this step.
6. **Publish:** posts go out automatically at scheduled times through the Meta Graph API.
7. **Learn:** pull performance data for our posts and competitors' posts, then feed the lessons back into the next cycle.

Around day 5, the next week is analysed and planned, and the plan is sent for approval. Once it's approved, the content is created before the current week ends, so there's never a gap in posting.

Subagents

Each subagent is a specialist with a detailed instruction file, examples of good and bad output, and a quality checklist. Its output is reviewed before moving to the next stage.

- **Researcher:** analyses the brand and local competitors using real data, such as public posts, comments and the Meta Ad Library, and notes where each finding came from.
- **Targeting Strategist:** builds detailed personas, for example a nervous first-time IELTS candidate in Dhaka who needs band 7 for Canada. Each persona covers fears, goals, the language they use, and when they're online.
- **Planner:** turns personas and past lessons into a balanced 7-day calendar that mixes posts that educate, build trust and sell, with formats and posting times for each.
- **Content Creator:** writes hooks, scripts, captions, hashtags and calls to action in the brand voice, then directs the image and video tools. It checks its own work against the checklist.
- **Analyst:** measures performance, compares it with competitors, and writes clear lessons into the brand's memory.

Project Structure (Claude Code)

- **CLAUDE.md** at the root: overall workflow, rules and conventions.
- **Subagent definitions:** one instruction file per subagent.
- **brands/** folder: one subfolder per brand, each containing:
  - Brand brief (product, audience, voice, language, rules and no-go topics)
  - Memory file (what has and hasn't worked, plus lessons learned)
  - Personas and competitor list
  - Weekly plans and generated content, organised by week
- **templates/** folder: an empty brand template for onboarding new brands.
- **Git** version control for code, instructions and memory.

Adding a New Brand (/new-brand command)

1. Run the /new-brand slash command.
2. The main agent asks one question at a time: name, website, products, audience, voice, language, competitors, and rules or no-go topics.
3. It creates the brand folder from the template and saves the brief.

4. It hands off to an onboarding subagent, which does deep research and targeting and fills in the memory files.
5. We confirm the summary, and the brand joins the weekly cycle.

No new code is needed for each brand. Setup takes about 15 minutes.

Content Production

- **Reels (main approach):** template-based video through code, using Creatomate, Shotstack or Remotion. It's reliable, low cost and stays on brand.
- **Optional:** AI avatars (HeyGen, Synthesia) for tip-style presenter videos, and AI video generation (Veo, Kling, Runway) for eye-catching footage.
- **Voiceover:** ElevenLabs, which supports English and Bangla.
- **Images and carousels:** generated with templates in the brand style.

Brand-specific rules: the Islamic courses brand defaults to no background music and no animated human figures, using voice-only audio, calligraphy and nature visuals. Religious content may only quote verses and hadith from an approved source list, and the reviewer subagent checks it closely, because a single mistake about a verse or ruling could damage trust.

Language rule (Bangladesh audience): all communication is in Bangla, including captions, voiceovers, hooks, on-screen explanations and calls to action. For the IELTS brand, the English learning material stays in English, such as sample answers, vocabulary, example sentences and test questions, and it's explained in Bangla. The reviewer subagent checks that every post follows this rule and that the Bangla sounds natural, not machine-translated.

Architecture and Deployment (Hybrid)

- **Local (Claude Code):** research, planning and content creation run on our machine when the weekly cycle is started.
- **Supabase Storage:** stores the final media, since Instagram's API needs media at a public URL. Local copies stay in the brand folders.
- **Supabase Database:** stores scheduled posts, captions, post times and all performance data.
- **Supabase Edge Function plus scheduler:** publishes each post to Meta at its scheduled time, so our computer doesn't need to stay on.

- **Weekly trigger:** started manually, or with a cron job or GitHub Actions.
- **Notifications:** a reminder by email or WhatsApp when the next week's plan is ready for approval.

Measuring Engagement and Reach

Our posts (Meta Insights API): reach, views, likes, comments, saves, shares, profile visits, follows from each post, and reel watch time.

Competitor posts (public data only): likes, comments and sometimes reel views. Reach isn't available.

Key metrics:

- **Engagement rate:** likes, comments, saves and shares added together, divided by reach.
- **Weighted signals:** saves and shares count more than likes.
- **Reel retention:** average watch time and completion.
- **Business results:** UTM-tagged links to track site visits, mock test bookings and course enrolments.
- **Competitor benchmark:** engagement relative to follower count, to spot their posts that stand out.

We take inspiration from competitors' winning formats but don't copy their content. Competitor data is collected within platform rules.

Prerequisites

- A Meta Business account with Facebook pages and Instagram business accounts connected.
- A Meta developer app with Graph API publishing and insights permissions, which requires app review.
- A Supabase project (already connected).
- API keys for the video tool and ElevenLabs.
- Claude Code set up in the project repository.

Suggested Build Order

1. Set up the project structure, CLAUDE.md and brand template.

2. Build the /new-brand command and onboard both brands.
3. Build the Researcher and Targeting Strategist subagents.
4. Build the Planner and Content Creator, including the video and image pipeline.
5. Set up Supabase storage, database tables and the publishing Edge Function.
6. Connect the Meta Graph API for publishing and insights.
7. Build the Analyst and the learning loop.
8. Run a supervised pilot week, adjust, then move to the weekly cycle.
